OBRIVE TECHNOLOGIES — PRODUCT STRATEGY

OB-FISH: COMMERCIAL LAUNCH ROADMAP

Transforming Multi-Agent Swarm Intelligence into an Enterprise-Ready SaaS Product

Target Product: Ob-Fish (MiroFish Engine)	**Target Domain:** https://obfish.obrive.com	**Date:** October 2026
Document Version: 1.0 (Enterprise Release)	**Author:** Obrive Technical Operations	**Status:** Ready for Engineering Sprint

1. Executive Summary

Ob-Fish represents a generational breakthrough in predictive decision intelligence. Powered by multi-agent swarm technology, the system ingests raw seed intelligence (policy briefs, market signals, dossiers, or corporate scenarios) and synthesizes a high-fidelity parallel digital society. Hundreds of autonomous agents with distinct psychological archetypes, persistent memories, and decision matrices interact freely, allowing enterprise decision-makers to *rehearse the future before committing real-world capital*.

While the underlying engine is technically validated, transforming it into a self-service, commercial B2B SaaS demands five fundamental pillars: **Legal compliance, Multi-tenant authentication, Background worker scalability, Token economics/billing, and Obrive enterprise branding**.

Core Strategic Mandate: Shift Ob-Fish from an open-source, single-tenant research script into a production-grade cloud platform capable of serving hundreds of concurrent enterprise simulations with strict data isolation, sustainable unit economics, and 99.9% reliability.

2. Legal & Licensing Framework (AGPLv3 Strategy)

The upstream MiroFish project is governed under the **GNU Affero General Public License v3 (AGPLv3)**. Under Section 13 of the AGPLv3, operators hosting the software over a network (SaaS) must provide access to the complete corresponding source code of the network-served application to all users.

Recommended Dual-Architecture Approach:

- **Decoupled Microservice Perimeter:** Retain the core simulation engine as an internal worker microservice. Build the commercial frontend, customer authentication, billing gateway, proprietary prompt templates, and analytics dashboard as a completely separate proprietary service (closed source) communicating via clean API contracts.
- **Open-Core SaaS Model:** Publicly release the base engine modifications under AGPLv3 (reinforcing developer trust), while gating proprietary value behind Obrive Enterprise Cloud (managed infrastructure, enterprise integrations, proprietary agent personas, and fine-tuned models).

- **Commercial Upstream Negotiation:** Engage original maintainers for a commercial dual-license exemption if a strictly closed-source proprietary distribution is legally required.

3. Architecture & Multi-Tenancy Modernization

Currently, MiroFish operates as a single-tenant local process with shared local filesystem state. To serve external customers, the platform must transition to an isolated multi-tenant architecture:

Component	Current State (Single-Tenant)	Target State (Obrive Cloud SaaS)
Identity & Auth	None. Direct open access to all APIs.	JWT / OAuth 2.0 (Google & Work Email), Supabase/FastAPI Auth, Org-level RBAC.
Data Isolation	Global project folder on local disk.	PostgreSQL with Tenant ID partitioning; Row-Level Security (RLS) enabled.
Execution Model	Synchronous Flask threads (server chokes on 2+ simulations).	Asynchronous Celery/Redis task queue with dedicated worker containers.
File & Dossier Storage	Local server uploads/ directory.	Encrypted S3 / Cloudflare R2 bucket with signed expiring download URLs.
Real-time Comms	Aggressive frontend HTTP polling.	WebSockets / Server-Sent Events (SSE) for streaming agent dialogues.

4. Token Economics & Monetization Strategy

A typical Ob-Fish multi-agent simulation generates between **100,000 and 600,000 LLM tokens** across ontology building, agent creation, turn-based dialogue, and synthesis reporting. Unrestricted access without token caps will result in severe financial exposure.

Recommended Pricing & Access Models:

- **Tier 1: BYOK (Bring Your Own Key) [Immediate Go-To-Market]:** Customers provide their own OpenAI, DeepSeek, or Claude API key in their profile settings. Obrive charges a flat platform subscription fee ($29 - $99/mo) with zero LLM COGS exposure for Obrive.
- **Tier 2: Managed Simulation Credits:** Obrive hosts the LLM pipeline (DeepSeek-V3 / GPT-4o-mini for cost efficiency) and bills customers per simulation credit (e.g., $15 per high-density simulation run).
- **Tier 3: Enterprise Bespoke:** Dedicated VPS instance, custom seed dossiers (e.g., Obpark intelligence), private fine-tuned model endpoints, and SLA guarantees.
- **Payment Gateways:** Stripe for global card processing and Razorpay for Indian domestic transactions, connected via secure webhook listeners.

5. Rebranding & Enterprise User Experience

To establish credibility in client meetings and demos, the interface must present a pure Obrive identity:

- **Brand Asset Sanitization:** Remove all legacy MiroFish logos, Shanda badges, and Chinese documentation/community links. Deploy official Obrive brand typography, color palette, and favicon.

- **Localization Audit:** Cleanse remaining Chinese strings in backend API error responses, simulation log feeds, and graph visualization tooltips.
- **Showcase Seed Library:** Ship pre-configured enterprise dossiers directly into user dashboards — including *Obpark Smart City Deployment*, *Fintech Regulatory Shockwave*, and *Brand Crisis Simulation* — enabling instant value demonstration.
- **Executive PDF Export:** Introduce 1-click executive intelligence export that formats simulation findings into an Obrive-branded executive summary PDF.

6. Security, Privacy & Enterprise Governance

Commercial clients will input proprietary strategic plans and confidential market data. Security is non-negotiable:

- **Zero-Data Retention Policy:** Ensure uploaded dossiers are encrypted at rest (AES-256) and provide an automated purge option to delete customer dossiers upon simulation completion.
- **API Key Security:** User-provided LLM API keys must be encrypted using client-side salted Fernet symmetric encryption before storing in the database.
- **DDoS & Edge WAF:** Route traffic through Cloudflare with strict rate-limiting on ontology generation endpoints to defend against automated exhaustion attacks.

7. Master 4-Phase Implementation Roadmap

Phase	Timeline	Key Deliverables	Outcome / Milestone
Phase 1: Brand & Polish	Week 1 (Days 1–5)	• Full Obrive UI white-labeling • Remove upstream logos & Chinese text • Polish mobile & desktop layout • Pre-load Obpark demo dossier	Flawless executive demo ready on obfish.obrive.com.
Phase 2: Auth & BYOK	Week 2–3 (Days 6–15)	• PostgreSQL schema + User table • JWT Authentication & Signup/Login • Project & dossier isolation per user • User API key vault (BYOK model)	Secure multi-user platform; zero LLM billing risk for Obrive.
Phase 3: Worker & Scale	Week 4 (Days 16–22)	• Redis + Celery task queue • Decouple simulation engine to workers • WebSockets / SSE real-time stream • S3 / Cloudflare R2 file storage	Reliable concurrency; system supports 50+ simultaneous simulations.
Phase 4: Billing & Launch	Week 5 (Days 23–30)	• Stripe & Razorpay checkout integration • Subscription tiers & credit gating • Terms of Service & Privacy docs • Cloudflare WAF & rate-limiting	Official Commercial Launch & Customer Onboarding ■

8. Recommended Immediate Next Steps

To kick off engineering execution in the coming days, the prioritized task sequence is:

1. **Frontend Asset Scrub:** Replace all logos, titles, and localized text in frontend/src to establish a complete Obrive visual identity.
2. **Database Setup:** Provision a managed PostgreSQL instance or local VPS Postgres container to store users, simulation sessions, and project metadata.
3. **Auth Layer Implementation:** Deploy lightweight JWT auth endpoints in backend/app/api/auth.py and bind project IDs to authenticated user tokens.
4. **BYOK Key Input Modal:** Allow users to enter their OpenAI / DeepSeek API keys directly in the frontend UI, passed via encrypted session headers.

Approved by: Obrive Leadership & Technical Operations **Deployment Target:** Hostinger VPS — Ubuntu LTS
